

## EXCHANGE SERVER 2007 SP1

Email, Fax and Voice – Unified

### OVERVIEW

Exchange Server 2007 SP1 is the latest version of the award-winning Microsoft email system. While the Exchange line has traditionally focused on email access, Exchange 2007 goes further. It now functions as a comprehensive communications platform, covering email, fax and voice.

### FEATURES

- **Server Role-based Structure:** Exchange 2007 is built into 5 specific Server Roles – Mailbox, Client Access, Hub Transport, Edge Transport, and Unified Messaging.
- **Email by Phone:** The new Unified Messaging Role adds Outlook Voice Access and Auto-Attendant. These two services allow users to perform standard tasks (read email, check calendars, compose messages) using a phone.
- **Built-in Spam/Virus/Phishing Protection:** The new Edge Transport Server Role secures the Exchange infrastructure against outside threats. While it cleans out spam, Hub Transport routes legitimate messages where they need to go.
- **64-bit Server Architecture:** Exchange Server 2007 was designed as a full 64-bit application. It takes advantage of the greater processing power in 64-bit hardware for functions such as continuous data replication (auto-copies in case of a crash). SP1 added full support for Windows Server 2008 and Windows Vista.
- **New Management:** The Exchange Management Console has been redesigned to a simpler 3-level interface. A new tool called AutoConnect now automatically sets up user email accounts.

### BENEFITS

**No More Information Overload.** With the new Unified Messaging role, Exchange funnels all types of business communication into one Inbox. Collect, store, and backup things like faxes and voicemails along with your email.

**Access e-mail, voice mail, calendar, and contacts virtually anywhere.** Thanks to Unified Messaging and mobile policy, you can access your information on your PC, a browser, your mobile device, or even a basic phone.

**Lower Total Cost.** Exchange 2007's new architecture has the ability to host more users, and larger mailboxes, on fewer servers than Exchange 2003. It also provides 3 disaster recovery methods, delivering failover capacity inside Exchange's system without a third-party expense.

**Safer Email.** Exchange 2007's server roles lower the risk of spam and viruses getting near your network. Local or mobile, Exchange delivers important messages where they need to go.
